

ilux Digital Shower

Aqualisa ilux digital shower mixer
(Processor, controller and remote)

IL1001 – For high water pressure
IL1002 – Incorporates a pump for low water pressure

your ilux bathroom

How ilux works

At the heart of ilux is the digital processor box. Once the bath or shower selection is made, hot and cold water flow into the processor where it is blended with thermostatic precision before flowing out and into the bath filler or shower head at the temperature and flow selected by the user.

Processor boxes are specific to the water systems of the bathroom, so you can choose one for a high pressure/combination boiler system or one that comes with an integral pump for gravity systems.

The wireless remote control can also be used to control the bath or shower. It will work up to 10 metres from the control. A low voltage data cable, concealed out of sight, connects the processor to the shower or bath control.

Locating the processor

The processor box is slimline, compact and smaller than a shoebox. Reflecting the uniqueness of every bathroom, it offers the flexibility to be conveniently sited away from the showering or bathing area in an easily accessible location: under the bath, in the loft, in an airing cupboard, the choice is yours.

Digital processor: Perfectly blends hot and cold water and dispenses it to the shower head at the selected temperature and flow.
